Alaska Responsible Fisheries Management (RFM) Certification Program
Guidance to Performance Evaluation for the Certification of Wild Capture and Enhanced Fisheries in Alaska
Draft Version 1.3
September 2015
Role of the Alaska Seafood Marketing Institute

The Alaska Seafood Marketing Institute (ASMI) is a public-private partnership between the State of Alaska and the Alaska seafood industry established to foster economic development of the State fisheries. ASMI is playing a key role in the repositioning of Alaska’s seafood industry as a competitive market-driven food production industry. Its work to boost the value of Alaska’s seafood product portfolio is accomplished through partnerships with retail grocers, foodservice distributors, restaurant chains, foodservice operators, universities, culinary schools, and the media. It conducts consumer campaigns, public relations and advertising activities, and aligns with industry efforts for maximum effectiveness. ASMI also functions as a brand manager of the Alaska Seafood family of brands.

Purpose of this Publication

This publication describes the guidance for assessment used in the evaluation of applicant fisheries to the Alaska Responsible Fisheries Management (RFM) Certification Program. Included are the specific performance levels for each clause given in the Conformance Criteria of the Alaska RFM Program that must be met to demonstrate certification status. Successful applicants will be awarded the claim of a responsibly managed fishery for sustainable use.

In combination with the normative documents of the accredited certification program, this publication will provide 1) recommendations for assessors operating on behalf of qualified certification bodies regarding consistent application of performance evaluation of fisheries against the Alaska RFM Conformance Criteria, 2) understanding of how levels of conformance for a given fishery are derived, 3) guidance to assessors for evaluating fishery applicants, and 4) guidance to fishery applicants regarding certification requirements.

I. Guidance to Performance Evaluation

Conformance Criteria, Confidence Ratings, and Performance Evaluation Outcomes

In the Alaska Responsible Fisheries Management (RFM) assessment process, clauses of the conformance criteria are scored using confidence ratings. A high confidence rating signifies full conformance to a clause. A medium confidence rating results from either gaps in information to demonstrate conformance to a clause, which may be clarified during the certification process, or from limited evidence of conformance to a clause. A low confidence rating signifies absence of evidence. A non-conformance (NC) is assigned when evidence or information acquired is insufficient to meet the intent of the clause (Table 1). Detailed explanations are provided below.

Full Conformance – High Confidence Rating

Sufficient information/evidence is available to demonstrate full conformance to a clause. In these cases a high confidence rating is assigned. Sufficient evidence is that which allows objective determination by the Assessment Team that a fishery fully complies with a given clause in the Alaska RFM Conformance Criteria.

Minor Non-Conformance – Medium Confidence Rating

Information/evidence is broadly available to demonstrate conformance to a clause although there are limited gaps in information that, if available, could clarify aspects of conformance and allow the Assessment Team to assign a high confidence rating. In these cases, a minor improvement is needed to achieve full conformance. For a medium confidence rating, a minor non-conformance is assigned. The Assessment Team will request further clarification of information with the Applicant and management organizations and this may result in the assignment of full conformance to a clause.

Major Non-Conformance – Medium Confidence Rating

Information/evidence is limited to demonstrate conformance to a clause. In these cases, a major improvement is needed to achieve full conformance. For a medium confidence rating, a major non-conformance is assigned. The Assessment Team will request further clarification of information with the Applicant and management organizations to confirm the non-conformance. Where further, substantive evidence is made available, assignment of either minor non-conformance or full conformance to a clause may occur.

Critical Non-Conformance – Low Confidence Rating

Information/evidence is completely absent or contradictory to demonstrate conformance to a clause. Absence of information/evidence results in a low confidence rating. In these cases, a critical non-conformance is assigned. A critical non-conformance will stop the certification assessment, unless the Applicant is able to provide information/evidence that demonstrates higher conformance of the fishery than that initially assessed.

Performance Evaluation Parameters

In the assessment process, each supporting clause is associated with scoring guidance to ensure continuity and consistency across fisheries and Assessment Teams. Scoring is based on a systematic approach to the assessment of the fishery against each clause using a series of Evaluation Parameters (EPs): Process, Current Status and Effectiveness, and Evidence Basis.
These are considered of equal importance and are scored using the categories previously discussed (high confidence rating = full conformance; medium confidence rating = minor or major non-conformance; low confidence rating = critical non-conformance). These EPs break down a clause using the performance related parameters below.

**Process**

This EP requires that evidence is provided on the process or system used by a fishery management organization to implement or maintain key aspects of fishery management practices. Examples may include systems for data collection, laws and regulations, stock assessment, and enforcement. If evidence on the current process/system of a given process-based requirement is scarce or nonexistent, then this EP is not satisfied resulting in non-conformance.

**Current Status/Appropriateness/Effectiveness**

This EP requires that the current status, appropriateness and effectiveness of an aspect of fisheries management practices are demonstrated. Examples include data collected, results of stock assessment including stock status, and enforcement data. If evidence on the current status/effectiveness of a given output-based requirement is scarce or nonexistent, then this EP is not satisfied resulting in non-conformance.

**Evidence Basis**

This EP requires that the availability/quality/adequacy of the evidence that is the base for scoring a given clause is assessed. If evidence availability (e.g., studies, reports, other data, and regulations) is scarce, low quality or non-existent, then this EP is not satisfied resulting in non-conformance.

The Assessment Team follows these guidelines when scoring a clause:

- If all EPs are satisfied, the clause is scored with a *High Confidence Rating* (Full Conformance).
- If one EP (i.e. any) is not satisfied, the clause is scored with a *Medium Confidence Rating* (Minor Non-Conformance).
- If two EPs (i.e. any) are not satisfied, the clause is scored with a *Medium Confidence Rating* (Major Non-Conformance).
- If more than two EPs (any) are not satisfied, the clause is scored with a *Low Confidence Rating* (Critical Non-Conformance).

Note that for some conformance criteria, not all EPs are applicable. This is because not all Conformance Criteria clauses require the presence of a process (e.g., a formal procedure), and not all clauses require an evaluation of the current status, the appropriateness and the effectiveness of the subject matter. The balance depends on the construction and type of supporting clause and its requirements. For instance, Current status/Appropriateness/Effectiveness can be used in combination or individually, depending on
the relevance to the clause. Finally, all clauses require the evaluation of the quality and adequacy of the Evidence Basis and this EP is consistent throughout all clauses. When one EP is not required, guidance is structured so that the balance of requirements of other EPs is always three or more. In this way, a balance of requirements for each clause is provided for the scoring process.

The RFM standard and related guidance is applicable to governance and management systems for small scale and/or data limited fisheries, where appropriate, provided their performance can be objectively verified, with due consideration to the availability of data and the fact that management systems can differ substantially for different types and scales of fisheries.

Conformance Criteria

A. The Fisheries Management System

1. There shall be a structured and legally mandated management system based upon and respecting International, National and local fishery laws, for the responsible utilization of the stock under consideration and conservation of the marine environment.

*FAO CCRF (1995) 7.1.3/7.1.4/7.1.9/7.3.1/7.3.2/7.3.4/7.6.8/7.7.1/10.3.1*
1.1 There shall be an effective legal and administrative framework established at local and national level appropriate for fishery resource conservation and management. The management system and the fishery operate in compliance with the requirements of local, national and international laws and regulations, including the requirements of any regional fisheries management agreement.

**Evaluation Parameters**

**Process:** Management agencies are physically and legally established at local and national level.

**Current status:** The output of the management organization(s) is in line with fishery resource management needs. Examples may include rule making, scientific research, stock and ecosystem assessments, implementation of rules and regulations, and enforcement activities.

**Appropriateness/Effectiveness:** The management framework is appropriate for managing the resource. For example, the larger the exploitation, vulnerability, or risks of a fish stock, the more work and precision shall be focused in managing the resource. This shall be done in compliance with legislative and regulatory requirements at the local, national and international level, including the requirements of any regional fisheries management agreement. The management system shall not be subject to continual unresolved or repeated disputes or political instability.

**Evidence Basis:** Evaluate availability, quality, and adequacy of the evidence. Examples may include fishery
management plans or other relevant information.
1.2 Management measures shall consider 1) the whole stock biological unit (i.e. structure and composition contributing to its resilience) over its entire area of distribution, 2) the area through which the species migrates during its life cycle and 3) other biological characteristics of the stock.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Management measures do <strong>not consider</strong> 1) the whole stock biological unit (i.e. structure and composition contributing to its resilience) over its entire area of distribution, 2) the area through which the species migrates during its life cycle and 3) other biological characteristics of the stock.</td>
<td>Management measures <strong>insufficiently consider</strong> 1) the whole stock biological unit (i.e. structure and composition contributing to its resilience) over its entire area of distribution, 2) the area through which the species migrates during its life cycle and 3) other biological characteristics of the stock.</td>
<td>Management measures <strong>moderately consider</strong> 1) the whole stock biological unit (i.e. structure and composition contributing to its resilience) over its entire area of distribution, 2) the area through which the species migrates during its life cycle and 3) other biological characteristics of the stock.</td>
<td>Management measures consider 1) the whole stock biological unit (i.e. structure and composition contributing to its resilience) over its entire area of distribution, 2) the area through which the species migrates during its life cycle and 3) other biological characteristics of the stock. Fulfils all parameters.</td>
</tr>
<tr>
<td>Lacking in all parameters.</td>
<td>Lacking in two parameters.</td>
<td>Lacking in one parameter.</td>
<td></td>
</tr>
</tbody>
</table>

**Evaluation Parameters**

Note on consideration of biological unity and other biological characteristics. Biological unity and biological characteristics shall be interpreted as relating to the stability or resilience of the stock – i.e. its ability to recover from or resist a shock or disturbance, such as the impact of a fishery. The management system must consider the relative ability of the stock to recover from or resist potential negative impacts. Characteristics considered shall include growth, fecundity, reproduction, lifespan, spawning cycle, population dynamics, impact of gear type, and essential habitat(s) needs and availability. Where life cycle and other biological characteristics are unknown, the management system shall ensure these uncertainties are factored into assessment and managing practices, as per the precautionary approach.

**Current Status/Appropriateness:** If a biological stock unit extends over the jurisdiction of two or more countries to any extent (either by distribution or migration), then exploitation by all parties shall be considered when defining exploitation levels and determining stock health to avoid overfishing/depletion of the resource. The scoring of this parameter shall consider that significant migration may take a species outside the jurisdiction of the managing agency (e.g. for significant feeding or ontogenic migration).

**Effectiveness:** Managers should conduct an assessment of stock structure and composition as these relate to stock resilience over its entire distribution area. The underlying objective is to preserve genetic variability between and within species, and avoid localized depletions (overall affecting the stock contributing to its resilience and stability). This assessment shall consider, when appropriate, demographic independence of populations or stocks (i.e., if a component stock of a species is demographically independent from another because it is genetically different, has significant difference in age-structure, or if there is insignificant exchange among groups due to distance, environmental barriers, or other reasons).

**Effectiveness:** The species may spend a portion of its life (migration for feeding, growth or reproduction) in both fresh and
saltwater, in international waters or in another country's jurisdiction, and may suffer mortality or other pressures. These must be accounted for when assessing stock health.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include the presence of genetic studies, age-structure data, stock assessments or other relevant information confirming the biological unit of the stock.

1.2.1 Previously agreed management measures established and applied in the same region shall be taken into account by management.

*FAO CCRF (1995) 7.3.1*

<table>
<thead>
<tr>
<th>Low Confidence Rating (Critical NC)</th>
<th>Medium Confidence Rating (Major NC)</th>
<th>Medium Confidence Rating (Minor NC)</th>
<th>High Confidence Rating (Full Conformance)</th>

<td>Previously agreed management measures established and applied in the same region are <strong>moderately</strong> considered.</td>
<td>Previously agreed management measures established and applied in the same region are taken into account by management.</td>
</tr>
<tr>
<td>Lacking in all parameters.</td>
<td>Lacking in two parameters.</td>
<td>Lacking in one parameter.</td>
<td>Fulfils all parameters.</td>
</tr>
</tbody>
</table>

**Evaluation Parameters**

Note: Taken into account means “included and accounted in the basis of management decisions”. “Previously agreed measures” includes local or national laws or regulations, and also any management measures put into place by RFMOs. Previous decisions can be reneged, altered and updated or maintained intact but must be included in the decision making process. If previously agreed measures are reneged, altered or updated, there shall be a scientific basis for the changes. Not taken into account may refer to management measures that are ignored although may be still legally binding in the fishery.

**Process:** There is a process or system that allows the continuity and updating of previously agreed and implemented management measures. Examples may include a specific review process or management plan where these measures can be clearly identified and continued implementation and updating can be carried out.

**Current Status/Appropriateness/Effectiveness:** Previously agreed-upon management measures established and applied in the same region are included and part of current management decisions. Examples may include international or other agreements not honored by the management system or a management agency. The management system is effectively continuing implementation of agreed management measures.

**Evidence Basis:** Documentary evidence is available supporting the above.

1.3 Where transboundary, straddling or highly migratory fish stocks and high seas fish stocks are exploited by two or more States, the applicant management organizations concerned shall cooperate and take part in formal fishery commission or arrangements that have been appointed to ensure effective conservation and management of the stock(s) in question.
There is no cooperation in formal fishery commission or arrangements that have been appointed to ensure effective conservation and management of the stock(s) in question.

Lacking in all parameters.

Where transboundary, straddling or highly migratory fish stocks and high seas fish stocks are exploited by two or more States, the applicant management organizations concerned cooperate and take part in formal fishery commission or arrangements that have been appointed to ensure effective conservation and management of the stock(s) in question.

Fulfils all parameters.

Evaluation Parameters

Note: This clause qualifies only if stock is either transboundary, straddling, highly migratory, or high seas. If not, this clause is NOT APPLICABLE. This clause is justified by the evidence provided in clause 1.2. Where sub-stocks are referred to as part of an overall stock there shall be sufficient information on biology, distribution, and life cycle that demonstrates the degree of association or disassociation, and basis for the management approach taken, to prevent recruitment failure of the stock or other negative impacts that are likely to be irreversible or very slowly reversible.

Process: There is a mechanism in place by which the applicant organization(s) cooperates for the management of the transboundary stock. This mechanism has the sustainable international exploitation of the stock as its main objective.

Current Status/Appropriateness/Effectiveness: There is evidence that the mechanism described in the process parameter is effective at ensuring the stock is sustainably exploited. This can take the form of evidence that the stock is not overfished or subject to overfishing across the entirety of the range of the biological stock.

Evidence Basis: Availability, quality, and adequacy of the evidence. Examples may include proof of formal agreements, records of meetings and decisions.

1.3.1 Conservation and management measures established for such stock within the jurisdiction of the relevant States for shared, straddling, high seas and highly migratory stocks, shall be compatible. Compatibility shall be achieved in a manner consistent with the rights, competences and interests of the States concerned.

FAO CCRF (1995) 7.1.3, 7.1.4, 7.1.5, 7.3.2, 10.3
There is **no** compatibility of management measures for the stock in question.

<table>
<thead>
<tr>
<th>Evaluation Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> This clause qualifies only if stock is either transboundary, straddling, highly migratory, or high seas. If not, this clause is <strong>NOT APPLICABLE.</strong> This clause is justified by the evidence provided in clause 1.2. Compatibility of management measures does not mean identical management measures but the approach shall be consistent with respect to the overall management and conservation goals of the shared or straddling stock.</td>
</tr>
<tr>
<td><strong>Process:</strong> Identification of common objectives for maintenance of stock biomass.</td>
</tr>
<tr>
<td><strong>Current Status/Appropriateness/Effectiveness:</strong> Implementation of measures fit to achieve the common objectives mentioned above (i.e., similar harvest rates based on stock status, common rebuilding objectives for depleted stocks).</td>
</tr>

1.4 A State not member/participant of a sub-regional or regional fisheries management organization shall cooperate, in accordance with relevant international agreements and law, in the conservation and management of the relevant fisheries resources by giving effect to any relevant measures adopted by such organization/arrangement.

*FAO CCRF 7.1.5*
participant State is not giving effect to any relevant measures adopted by such organization or arrangement.

Lacking in all parameters.

participant State is insufficiently giving effect to any relevant measures adopted by such organization or arrangement.

Lacking in two parameters.

participant State is moderately giving effect to any relevant measures adopted by such organization or arrangement.

Lacking in one parameter.

participant of a sub-regional or regional fisheries management organization cooperates, in accordance with relevant international agreements and law, in the conservation and management of the relevant fisheries resources by giving effect to any relevant measures adopted by such organization or arrangement.

Fulfils all parameters.

**Evaluation Parameters**

Note this clause qualifies only if stock is either transboundary, straddling, highly migratory, or high seas. If not, this clause is NOT APPLICABLE. This clause is justified by the evidence provided in clause 1.2.

**Process:** There is ongoing cooperation in stock assessment, data sharing, and other activities.

**Current Status/Appropriateness/Effectiveness:** Relevant measures are implemented by non-member country.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include reports detailing results of common surveys or acceptable harvest rates.

1.4.1 States seeking to take any action through a non-fishery organization which may affect the conservation and management measures taken by a competent sub-regional or regional fisheries management organization or arrangement shall consult with the latter, in advance to the extent practicable, and take its views into account.

*FAO CCRF 7.3.5*

</tbody>
</table>
Lacking in all parameters. | Lacking in two parameters. | Lacking in one parameter. | Fulfils all parameters.
---|---|---|---

**Evaluation Parameters**

**Process:** There is an agreed-upon system to finance the fishery management organizations and arrangements.

**Current Status/Appropriateness/Effectiveness:** The fishery management organizations and arrangements are currently financed using a cost recovery or other system.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include data showing the expenditure and cost recovery derived from fisheries management.

1.6.1 Without prejudice to relevant international agreements, States shall encourage banks and financial institutions not to require, as a condition of a loan or mortgage, fishing vessels or fishing support vessels to be flagged in a jurisdiction other than that of the State of beneficial ownership where such a requirement would have the effect of increasing the likelihood of non-compliance with international conservation and management measures.

*FAO CCRF 7.8.1*

| Low Confidence Rating (Critical NC) | Medium Confidence Rating (Major NC) | Medium Confidence Rating (Minor NC) | High Confidence Rating (Full Conformance) |
The State **does** encourage banks and financial institutions to require, as a condition of a loan or mortgage, fishing vessels or fishing support vessels to be flagged in a jurisdiction other than that of the State of beneficial ownership.

The State **insufficiently** encourages banks and financial institutions not to require, as a condition of a loan or mortgage, fishing vessels or fishing support vessels to be flagged in a jurisdiction other than that of the State of beneficial ownership.

The State only **moderately** encourages banks and financial institutions not to require, as a condition of a loan or mortgage, fishing vessels or fishing support vessels to be flagged in a jurisdiction other than that of the State of beneficial ownership.

The State encourages banks and financial institutions not to require, as a condition of a loan or mortgage, fishing vessels or fishing support vessels to be flagged in a jurisdiction other than that of the State of beneficial ownership where such a requirement would have the effect of increasing the likelihood of non-compliance with international conservation and management measures.

Lacking in all parameters. Lacking in two parameters. Lacking in one parameter. Fulfils all parameters.

### Evaluation Parameters

**Note:** The fishery for the stock under consideration occurs outside the exclusive economic zone (EEZ), there is evidence for presence of flags of convenience, and for IUU fishing. Not Applicable otherwise.

**Process:** There is a system that encourages banks to require vessels to be flagged outside the jurisdiction of interest.

**Current Status/Appropriateness/Effectiveness:** There is regulation that directs for vessels to be flagged outside the state’s jurisdiction. The fishery for the stock under consideration occurs outside EEZ, and there are flags of convenience operations present, or evidence of illegal, unreported, and unregulated fishing.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include data showing fishery operation by vessels flying a flag different from that of the state where fishing geographically occurs.

1.7 Procedures shall be in place to keep the efficacy of current conservation and management measures and their possible interactions under continuous review to revise or abolish them in the light of new information.

- Review procedures shall be established within the management system.
- A mechanism for revision of management measures shall exist.

*FAO CCRF 7.6.8*

| Low Confidence Rating (Critical NC) | Medium Confidence Rating (Major NC) | Medium Confidence Rating (Minor NC) | High Confidence Rating (Full Conformance) |
There are no procedures in place to review the efficiency of current conservation and management measures. Lacking in all parameters.

There are insufficiently effective procedures in place to review the efficiency of current conservation and management measures. Lacking in two parameters.

There are moderately effective procedures in place to review the efficiency of current conservation and management measures. Lacking in one parameter.

Procedures are in place to keep the efficacy of current conservation and management measures and their possible interactions under continuous review to revise or abolish them in the light of new information. Fulfils all parameters.

### Evaluation Parameters

**Process:** There is a procedure to review management measures. The procedure includes the use of outcome indicators against which the success of management measures in achieving specific management objectives is measured. The procedure covers all management measures, including those relating to the sustainable exploitation of the target stock, the mitigation of negative impacts on non-target species through bycatch, discarding, and indirect effects, and the protection of ETP species and the physical environment.

**Current Status/Appropriateness/Effectiveness:** If, as a result of the review process, it is determined that management measures are not achieving the specific management objectives they are designed to achieve, they are revised and updated as appropriate.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include data showing recent regulation revisions.

### 1.8

The management arrangements and decision making processes for the fishery shall be organized in a transparent manner.
- Management arrangements,
- Decision making.

*FAO CCRF 7.1.9*
Lacking in all parameters.

Lacking in two parameters.

Lacking in one parameter.

Fulfils all parameters.

### Evaluation Parameters

**Current Status:** There is transparency in management arrangements.

**Effectiveness:** There is transparency in decision making processes.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include records of the management arrangements and decision making processes.

### 1.9

Management organizations not party to the Agreement to promote compliance with international conservation and management measures by vessels fishing in the high seas shall be encouraged to accept the Agreement and to adopt laws and regulations consistent with the provisions of the Agreement.

*FAO CCRF 8.2.6*
There is no accepted Agreement and consistent laws and regulations.

Lacking in all parameters.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The management system has accepted the Agreement but with insufficient adoption of consistent laws and regulations.</td>
<td>Lacking in two parameters.</td>
</tr>
<tr>
<td>The management system has accepted the Agreement but with moderate adoption of consistent laws and regulations.</td>
<td>Lacking in one parameter.</td>
</tr>
<tr>
<td>The Fishery Management organization is party to the Agreement to promote compliance with international conservation and management measures by vessels fishing in the high seas or has adopted laws and regulations consistent with the provisions of the Agreement.</td>
<td>Fulfils all parameters.</td>
</tr>
</tbody>
</table>

**Evaluation Parameters**

Not Applicable if the fishery does not occur in high seas.

**Process:** The Agreement is accepted and relevant regulation adopted.

**Current Status/Appropriateness/Effectiveness:** These laws are regulating high seas fishing activity. Describe how they accomplish this.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include reports on the management of high seas fishing activities.

2. Management organizations shall participate in coastal area management institutional frameworks, decision-making processes and activities related to the fishery and its users, in support of sustainable and integrated resource use, and conflict avoidance.

*FAO CCRF (1995) 10.1.1/10.1.2/10.1.4/10.2.1/10.2.2/10.2.4*

2.1 An appropriate policy, legal and institutional framework shall be adopted in order to achieve sustainable and integrated use of living marine resources, taking into account 1) the fragility of coastal ecosystems and finite nature of their natural resources; 2) allowing for determination of the possible uses of coastal resources and govern access to them, 3) taking into account the rights and needs of coastal communities and their customary practices to the extent compatible with sustainable development. In setting policies for the management of coastal areas, 4) States shall take due account of the risks and uncertainties involved.

### Evaluation Parameters

**Process:** A mechanism exists by which the integrated management of multiple coastal area uses is conducted, the possible uses of coastal resources are assessed, and access to them is governed. Accordingly, policies for the management of the coastal area are set.

**Current Status/Appropriateness/Effectiveness:** The coastal management framework includes explicit consideration of the fragility of coastal ecosystems, the finite nature of coastal resources, and the needs of coastal communities, and accounts for the rights and customary practices of coastal communities. These policies take due account of risks and uncertainties.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include coastal management plans or other policy documents and frameworks for resource/coastal management.

2.1.1 States shall establish mechanisms for cooperation and coordination among national authorities involved in planning, development, conservation and management of coastal areas.  

*FAO CCRF 10.4.1*
### Evaluation Parameters

**Process:** There is a mechanism to allow cooperation between neighboring countries to improve coastal resource management.

**Current Status/Appropriateness/Effectiveness:** There are records of cooperation. Examples may include fishery, aquaculture, or other agreements or records from international fora.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include reports or data on the international cooperation/information exchange in these events.

### States shall ensure that the authority or authorities representing the fisheries sector in the coastal management process have the appropriate technical capacities and financial resources.

*FAO CCRF (1995) 10.4.2*

## Evaluation Parameters

**Process:** Describe how fishery related information is disseminated and the process in place to consult with fishery sector and fishing communities.

**Current Status/Appropriateness/Effectiveness:** There are records of consultations with fishing communities and the fisheries sector. Attempts have been made to create public awareness on the need for protection and management of coastal resources, and those affected by the management process have been made aware of its provision.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include public records of consultation activities and other available documentation, published on the internet or distributed at public meetings.

### 2.3 Fisheries practices that avoid conflict among fishers and other users of the coastal area (e.g. aquaculture, tourism, energy) shall be adopted and fishing shall be regulated in such a way as to avoid risk of conflict among fishers using different vessels, gear and fishing methods. Procedures and mechanisms shall be established at the appropriate administrative level to settle conflicts which arise within the fisheries sector and between fisheries resource users and other coastal users.

**Evaluation Parameters**

Note: The use of artificial structures may be appropriate for some stocks but not necessary for all. This clause may therefore not be applicable if such structures are not practical or appropriate for stocks. The use of artificial structures should be considered appropriate if one or more of the species under assessment has benefitted from the use of artificial structures in other fisheries, or if species with similar biological characteristics have benefitted from the use of artificial structures in other fisheries.

**Process:** There is a mechanism in place for increasing stock populations and enhancing fishing opportunities through the use of artificial structures. Management plans for artificial reefs or fish aggregation devices integrated within the framework of coastal area management plans take into account the interest of fishers.

**Current Status/Appropriateness/Effectiveness:** Management plans for artificial reefs or fish aggregation devices have been effectively integrated within the framework of coastal area management plans, and these plans effectively take into account the interest of fishers, including artisanal and subsistence fishers.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various laws, plans, data and reports.

---

2.8 In the case of activities that may have an adverse transboundary environmental effect on coastal areas, States shall:
a) Provide timely information and if possible, prior notification to potentially affected States.

b) Consult with those States as early as possible.

</table>

3.2.5 There shall be management objectives seeking to avoid, minimize or mitigate impacts of the unit of certification on essential habitats for the stock under consideration and on habitats that are highly vulnerable to damage by the fishing gear of the unit of certification.
Evaluation Parameters

**Process:** There is a mechanism in place by which the habitats essential to the stock under consideration and the potential impacts of the fishery (i.e. employing bottom contact gear) upon them are identified. This or a similar mechanism shall also be in place to identify habitats which are highly vulnerable to fishery activities by the Unit of Certification. The information provided by these mechanisms shall be used to produce specific management objectives related to avoiding significant negative impacts on habitats. When identifying highly vulnerable habitats, there value to ETP species shall be also considered, with habitats essential to ETP species being categorized accordingly. Note that this clause shall consider Alaska specific designation of important and essential fish habitats categorized as such at the State and federal level.

**Current Status/Appropriateness/Effectiveness:** There is evidence that the objectives described above are in place, and that effective management measures relative to those have been implemented.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various regulations, fishery management plans, data and reports.

3.2.6 There shall be management objectives that seek to minimize adverse impacts of the unit of certification, including any enhancement activities, on the structure, processes and function of aquatic ecosystems that are likely to be irreversible or very slowly reversible.

</table>

**Evaluation Parameters**

**Process:** There is a process in place by which adverse impacts of the fishery, including any enhancement activities, on the structure, processes and function of aquatic ecosystems that are likely to be irreversible or very slowly reversible are identified. This process results in setting relative management objectives. Management priority shall be focused primarily towards minimizing and avoiding impacts.

**Current Status/ Appropriateness/ Effectiveness:** There are management measures in place which have been developed to achieve the objectives described in the process parameter, and have been successful in doing so.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include fishery management plans, or other regulatory document or laws.
B. Science and Stock Assessment Activities

4. There shall be effective fishery data (dependent and independent) collection and analysis systems for stock management purposes.

\[\text{FAO CCRF (1995) 7.1.9/7.4.4/7.4.5/7.4.6/8.4.3/12.4} \]
\[\text{FAO ECO (2009) 29.1-29.3} \]
\[\text{FAO Eco (2011) 36.1, 36.3-36.5, 37.4} \]

4.1 All fishery removals and mortality of the target stock(s) shall be considered by management. Specifically, reliable and accurate data required for assessing the status of fishery/ies and ecosystems - including data on retained catch, bycatch, discards and waste shall be collected. Data can include relevant traditional, fisher or community knowledge, provided their validity can objectively be verified. These data shall be collected, at an appropriate time and level of aggregation, by relevant management organizations connected with the fishery, and provided to relevant States and sub-regional, regional and global fisheries organizations.

\[\text{FAO CCRF (1995) 7.3.1, 7.4.6, 7.4.7, 12.4} \]
\[\text{FAO Eco (2009) 29.1-29.3} \]
\[\text{FAO Eco (2011) 36.1, 36.3, 36.4} \]

Evaluation Parameters

Note that provision of data to relevant States and sub-regional, regional and global fisheries organizations is dependent on the nature of the stock (i.e., shared, high seas stock) and the type or arrangement in place for co-management (i.e., commission, arrangement etc.). This part of the clause does not apply in cases where stocks occur entirely in one’s State EEZ/jurisdiction and “co-management” with another country is not required.

**Process:** There is a process or system that allows for effective data collection (including data on retained catch, bycatch, discards and waste) on the status of fisheries and ecosystems for management purposes. In the case of stocks fished by more than one state, this includes a system or agreement with other states to ensure mortality and removals data are available for the entirety of the biological stock. Some fisheries and/or fish stock are hard to monitor for various reasons, including remoteness of operation/distribution and complexity of fishing operations, posing particular challenges with the collection and maintenance of adequate, reliable and current data and/or other information. Assessors shall acknowledge and explain these challenges, data collection and maintenance to cover all stages of fishery development, in accordance with applicable international standards and practices.

**Current Status/Appropriateness/Effectiveness:** There are appropriate and reliable data collection and estimation methods. Reliable and accurate data are collected on retained catch, bycatch, discards and waste (for directed and non-directed fisheries), and the direct and indirect impacts of the fishery on the ecosystem. Such information is disseminated to all relevant fishery management authorities. Overall, the data collection system is considered effective for the purposes of this clause if fishery scientists believe there is a high probability that the total estimated mortality is an accurate reflection of the actual total mortality across the entire biological stock. Fishery data are collected with a frequency and level of aggregation which allows the effective and informed management of the stock by all relevant authorities. The appropriate level of aggregation will often be the entire biological stock, but could also reflect specific habitats, gear types, sub-populations etc. The requirements for data collection are focussed on the need to assess the effects of the unit of certification on non-target stocks. Non-target catches and discards refers to species/stocks that are taken by the unit of certification other than the stock for which certification is being sought. The adequacy of data relates primarily to the quantity and type of data collected (including sampling coverage) and depends crucially on the nature of the systems being monitored and purposes to which the data are being put. Some analysis of the precision resulting from sampling coverage would normally be part of an assessment of adequacy and reliability. The currency of data is important inter alia because its capacity for supporting reliable assessment of current status and trends declines as it gets older. Adequate, reliable and current data and/or other information can include relevant traditional, Fisher or community knowledge, provided its validity can be objectively verified (i.e. the knowledge has been collected and analysed though a systematic, objective and well-designed process, and is not just hearsay).

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports, catch and observer data.

4.1.1 Timely, complete and reliable statistics shall be compiled on catch and fishing effort and maintained in accordance with applicable international standards and practices and in sufficient detail to allow sound statistical analysis for stock assessment. Such data shall be updated regularly and verified through an appropriate system. The use of research results as a basis for the setting of management objectives, reference points and performance criteria, as well as for
ensuring adequate linkage, between applied research and fisheries management (e.g. adoption of scientific advice) shall be promoted. Results of analysis shall be distributed accordingly as a contribution to fisheries conservation, management and development.

</tr>
</tbody>
</table>

**Evaluation Parameters**

**Process:** There is a process or system that allows for the production, maintenance, update, and verification of statistical data to international standards. Such standards include the FAO coordinating working party on fishery statistics Handbook of
Fishery Statistical Standards. Also, there is a process for the use and distribution of research results as a basis for the setting of management objectives, reference points and performance criteria, as well as for ensuring adequate linkage between applied research and fisheries management (e.g. adoption of scientific advice).

**Current Status/Appropriateness/Effectiveness:** There is evidence for the production, maintenance, updating and review of statistical data on catch and fishing effort in the fishery under assessment. There is evidence that the best and most up-to-date scientific information is used to inform the fisheries management process. Where there is a legal requirement for the advice of scientific authorities to be adopted, this shall be viewed as conformance with this evaluation parameter.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports and other data.

4.1.2 In the absence of specific information on the “stock under consideration”, generic evidence based on similar stocks can be used for fisheries with low risk to that “stock under consideration”. However, the greater the risk of overfishing, the more specific evidence is necessary to ascertain the sustainability of intensive fisheries.

*FAO Eco (2009) 30.4
FAO ECO (2011) 37.4*
If appropriate, there is no use of generic evidence based on similar stocks for fisheries with low risk to that “stock under consideration”.

Lacking in all parameters.

If appropriate, there is insufficient availability or use of generic evidence based on similar stocks for fisheries with low risk to that “stock under consideration”, taking into account that the greater the risk of overfishing, the more specific evidence is necessary to ascertain the sustainability of intensive fisheries.

Lacking in two parameters.

If appropriate, there is moderate availability or use of generic evidence based on similar stocks for fisheries with low risk to that “stock under consideration”, taking into account that the greater the risk of overfishing, the more specific evidence is necessary to ascertain the sustainability of intensive fisheries.

Lacking in one parameter.

In the absence of specific information on the “stock under consideration”, generic evidence based on similar stocks can be used for fisheries with low risk to that “stock under consideration”. However, the greater the risk of overfishing, the more specific evidence is necessary to ascertain the sustainability of intensive fisheries.

Fulfils all parameters.

Evaluation Parameters

Note: if the fishery for the stock under consideration is managed fully using stock-specific information then this clause can be scored with full conformance.

Process: There is a process that allows for the use of generic evidence based on similar stocks for fisheries with low risk to that “stock under consideration”. The greater the risk, the more specific evidence is necessary to assess sustainability. In principle, ‘generic evidence based on similar stocks’ should not suffice, but it may be adequate where there is low risk to the stock under consideration. In general, "Low risk to the stock under consideration" would suggest that there is very little chance of the stock becoming overfished, for example where the exploitation rate is very low and the resilience of the stock is high. However, the evidence for low risk and the justification for using surrogate data shall come from the stock assessment itself.

Current Status/Appropriateness/Effectiveness: Information has been utilized from generic evidence based on similar fishery situations. Based on the risk of overfishing, the information utilized is of higher precision to account for higher risks (i.e. intensive fisheries).

Evidence Basis: Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports and other data.

4.2 An observer scheme designed to collect accurate data for research and support compliance with applicable fishery management measures shall be established.

**Evaluation Parameters**

Note: If the stock is fully managed by one state and there is no need for shared stock research (between two or more jurisdictions), then this clause is not applicable.

**Process**: There is a system in place to manage the conduct of research vessels operating in waters under the jurisdiction of other states.

**Current Status/Appropriateness/Effectiveness**: If so, there is record of such shared research activities and they comply with required regulations.

**Evidence Basis**: Availability, quality, and adequacy of the evidence. Examples may include survey reports.

---

4.8 States shall promote the adoption of uniform guidelines governing fisheries research conducted on the high seas and shall, where appropriate, support the establishment of mechanisms, including, *inter alia*, the adoption of uniform guidelines, to facilitate research at the sub-regional or regional level and shall encourage the sharing of such research results with other regions.

*FAO CCRF 12.15, 12.16*
Does not promote adoption of uniform guidelines governing high seas research or sharing of data between regions or sub-regions.

Lacking in all parameters.

Lacking in two parameters.

Lacking in one parameter.

Fulfils all parameters.

Evaluation Parameters

If the stock is fully managed by one state and there is no need for shared stock research (between two or more jurisdictions), then this clause is not applicable.

Process: There is a mechanism in place to allow the development and review of guidelines governing fisheries research conducted on the high seas.

Current Status/Appropriateness/Effectiveness: There is a record of uniform high seas research guidelines or a mechanism to create them.

Evidence Basis: Availability, quality, and adequacy of the evidence. Examples may include survey reports, high seas guidelines.

4.9 States and relevant international organizations shall promote and enhance the research capacities of developing countries, *inter alia*, in the areas of data collection and analysis, information, science and technology, human resource development and provision of research facilities, in order for them to participate effectively in the conservation, management and sustainable use of living aquatic resources.

**Current Status/Appropriateness/Effectiveness:** There is evidence data was properly analyzed. Data was published respecting, where appropriate, confidentiality agreements. The rules of confidentiality are effectively respected.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various data or reports.
C. The Precautionary Approach

6. The current state of the stock shall be defined in relation to reference points or relevant proxies or verifiable substitutes allowing for effective management objectives and targets. Remedial actions shall be available and taken where reference point or other suitable proxies are approached or exceeded.

FAO CCRF (1995) 7.5.3, 7.6.1
FAO Eco (2009) 29.2-29.2bis, 29.6, 30-30.2
FAO Eco (2011) 36.2, 36.3, 37, 37.1, 37.2

6.1 States shall establish safe target reference point(s) for management.

Evaluation Parameters

**Process:** A target reference point(s) or proxy has been officially established. Managers shall be able to apply technical measures to reduce fishing pressure in the event that reference points are approached or exceeded.

**Current Status/Appropriateness/Effectiveness:** The official target reference point or proxy is consistent with achieving maximum sustainable yield (MSY) or a suitable proxy, and there is evidence that it has been used as an objective by the management process. If there are historical instances of the reference point being approached or exceeded, managers have taken remedial action as appropriate. In the context of reference points, when data are insufficient to estimate reference points directly other measures of productive capacity can serve as reasonable substitutes or “proxies”. Suitable proxies may be, for example, standardized cpue as a proxy for biomass or specific levels of fishing mortality and biomass which have proven useful in other fisheries and can be used with a reasonable degree of confidence in the absence of better defined levels. It is important to note that the use of a proxy may involve additional uncertainty, and if so, should trigger the use of extra precaution in the setting of biological reference points.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports or fishery management plans.
6.2 States shall establish safe limit reference point(s) for exploitation (i.e. consistent with avoiding recruitment overfishing or other impacts that are likely to be irreversible or very slowly reversible). When a limit reference point is approached, measures shall be taken to ensure that it will not be exceeded. For instance, if fishing mortality (or its proxy) is above the associated limit reference point, actions should be taken to decrease the fishing mortality (or its proxy) below that limit reference point.

<td>Fulfils all parameters.</td>
</tr>
</tbody>
</table>

**Evaluation Parameters**

**Process**: A scientifically based limit reference point or proxy has been officially established, together with the measure to be taken to ensure it will not be exceeded.

**Current Status/Appropriateness/Effectiveness**: The stock under assessment shall not currently be overfished (as defined by the competent Alaska authorities) according to the best available scientific understanding. The stock is currently estimated to be on the sustainable side of this reference point (e.g. SSB is above limit reference point, F is below F_{lim}, etc.). The limit reference point or proxy is consistent with avoiding recruitment overfishing and other severe negative impacts on the stock. There are mechanisms in place (e.g. harvest control rule or mechanism) to ensure that the level of fishing pressure is reduced if the limit reference point is approached or reached, and these mechanisms are consistent with ensuring to a high degree of certainty that the limit reference point will not be exceeded and that actions are taken to decrease the fishing mortality (or its proxy) below that limit reference point. The level of Blim should be set on the basis of historical information, applying an appropriate level of precaution according to the reliability of that information. In addition, an upper limit should be set on fishing mortality, Blim, which is the fishing mortality rate that, if sustained, would drive biomass down to the Blim level. It is important to clarify that for salmon, spawning escapement goals are a suitable proxy for the intent of this clause. Escapement goal performance shall be considered as a suitable reference point for salmon management. Specific to this point, underperforming salmon stocks that do not meet their escapement goals shall be appropriately managed within the Stock of Concern framework by the State of Alaska and scored accordingly within the assessment.

**Evidence Basis**: Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports or fishery management plans.
6.3 Data and assessment procedures shall be installed measuring the position of the fishery in relation to the reference points. Accordingly, the stock under consideration shall not be overfished (i.e. above limit reference point or proxy) and the level of fishing permitted shall be commensurate with the current state of the fishery resources, maintaining its future availability, taking into account that long term changes in productivity can occur due to natural variability and/or impacts other than fishing.

**Evaluation Parameters**

**Process:** Data and assessment procedures (i.e. stock assessment process) are in place to measure the position of the fishery in relation to the target and limit reference points.

**Current Status/Appropriateness/Effectiveness:** The current status of the stock in relation to reference points, is used to determine the level of fishing permitted, to ensure the latter is commensurate with the current state of the fishery resources (i.e. close to or above target reference point and most importantly, not overfished or below its limit reference point or proxy) taking into account that long term changes in productivity can occur due to natural variability and/or impacts other than fishing. The stock shall be ideally positioned above the midway point between target and limit reference point. It is important to clarify that, for salmon, spawning escapement goals are a suitable proxy for the intent of this clause. Escapement goal performance shall be considered as a suitable reference point for salmon management. Specific to this point, underperforming salmon stocks that do not meet their escapement goals shall be appropriately managed within the Stock of Concern framework by the State of Alaska.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports or fishery management plans.
6.4 Management actions shall be agreed to in the eventuality that data sources and analyses indicate that these reference points have been exceeded.

*FAO CCRF (1995)* 7.5.3

1 FAO Technical Guidelines for Responsible Fisheries No.2 – Precautionary approach to capture fisheries and species introductions.
Evaluation Parameters

**Process:** There are management measures, regulations, and laws that command or direct for the use of the precautionary approach (PA) to conservation, management and exploitation of the aquatic resources under assessment. This could either take the form of an explicit commitment to the application of the PA, or could be evidenced by an over-arching approach applied throughout the management literature.

**Current Status/Appropriateness/Effectiveness:** There is evidence for the practical application of the PA to resource management and conservation. Note that the PA may be integrated in stock assessment practices, in specific management measures enacted for everyday fisheries operations, or other measures. Application of the PA takes in due account of stock enhancement procedures, where appropriate, and relevant uncertainties are taken into account using a suitable method of risk assessment, including those associated with the use of introduced or translocated species.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports, fishery management plans and other documents.

7.1.1 In implementing the precautionary approach, States shall take into account, *inter alia*, of uncertainties relating to the size and productivity of the stocks, reference points, stock
condition in relation to such reference points, levels and distribution of fishing mortality and the impact of fishing activities, including discards, on non-target and associated or dependent species as well as environmental and socio-economic conditions.

**FAO CCRF (1995) 7.5.2**

<td>Lacking in one parameter.</td>
<td>Fulfils all parameters.</td>
</tr>
</tbody>
</table>

**Evaluation Parameters**

**Process:** There is a system in place under which the potential uncertainties listed above can be examined and taken into account during the decision-making process.

**Current Status/Appropriateness/Effectiveness:** There is evidence to demonstrate that in the fishery under assessment, uncertainties considered include those associated with the size and productivity of the stocks, reference points, stock condition in relation to such reference points, levels and distribution of fishing mortality and the impact of fishing activities, including discards, on non-target and associated or dependent species as well as environmental and socio-economic conditions.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include stock assessment reports, fishery management plans and other documents.

**FAO CCRF (1995) 7.5.1, 12.3**

7.1.2 In the absence of adequate scientific information, appropriate research shall be initiated in a timely fashion.
In the absence of adequate scientific information, appropriate research is **not** initiated in a timely fashion.

Lacking in all parameters.

### Evaluation Parameters

**Process:** There is a process that identifies weaknesses in the scientific information available to fishery managers, and initiates additional research as necessary.

**Current Status/Appropriateness/Effectiveness:** There is evidence that such a process has been applied in the case of the fishery under assessment, including examples of initiated research. Depending on the situation, appropriate research or further analysis of the identified risk is initiated in a timely fashion.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various data or scientific reports.

---

7.2 In the case of new or exploratory fisheries, States shall adopt as soon as possible cautious conservation and management measures, including, *inter alia*, catch limits and effort limits. Such measures should remain in force until there are sufficient data to allow assessment of the impact of the fisheries on the long-term sustainability of the stocks, whereupon conservation and management measures based on that assessment should be implemented. The latter measures should, if appropriate, allow for the gradual development of the fisheries.
For new and exploratory fisheries, no procedures are in place for promptly applying precautionary management measures, including catch or effort limits, and no provisions have been made for their gradual introduction and development, by establishing cautious conservation measures while sufficient data are collected to evaluate the impacts of the new fishery.

Lacking in all parameters.

For new and exploratory fisheries, insufficiently effective procedures are in place for promptly applying precautionary management measures, including catch or effort limits, and insufficient provisions have been made for their gradual introduction and development, by establishing cautious conservation measures while sufficient data are collected to evaluate the impacts of the new fishery.

Lacking in two parameters.

For new and exploratory fisheries, moderately effective procedures are in place for promptly applying precautionary management measures, including catch or effort limits, and moderate provisions have been made for their gradual introduction and development, by establishing cautious conservation measures while sufficient data are collected to evaluate the impacts of the new fishery.

Lacking in one parameter.

In the case of new or exploratory fisheries, States adopt as soon as possible cautious conservation and management measures, including, inter alia, catch limits and effort limits. Such measures remain in force until there are sufficient data to allow assessment of the impact of the fisheries on the long-term sustainability of the stocks, whereupon conservation and management measures based on that assessment are implemented. The latter measures allow, if appropriate, for the gradual development of the fisheries.

Fulfil all parameters.

**Evaluation Parameters**

*Note. This clause is only applicable for new or exploratory fisheries.*

**Process:** For new or exploratory fisheries there is a process that allows the immediate application of precautionary management measures and provisions, including catch or effort limits, and for the impact assessment of such fisheries on the long-term sustainability of the stocks.

**Current Status/Appropriateness/Effectiveness:** There is evidence for the implementation of these catch and effort limits, and other management measures including the impact assessment performed for these fisheries.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various data or scientific reports.

7.3 Contingency plans shall be agreed in advance for the appropriate management response to serious threats to the resource as a result of overfishing or adverse environmental changes or
other phenomena adversely affecting the fishery resource. Such measures may be temporary and shall be based on best scientific evidence available.

**FAO CCRF (1995) 7.5.5**

There are **no effective conservation and management measures** designed to ensure long term sustainability of fishery resource at levels which promote the objective of optimum utilization based on verifiable and objective information.

Lacking in all parameters.

Evaluation Parameters

**Process:** The process by which management measures are developed for the fishery utilizes the best available scientific evidence, including traditional sources where these are verifiable, and also considers the cost-effectiveness and social impact of potential new measures.

**Current Status/Appropriateness/Effectiveness:** There is evidence that the management measures in place are effective at achieving the long-term optimum yield, which is defined by the FAO as “the harvest levels for a species that achieves the greatest overall benefits, including economic, social and biological considerations”. If the stock has been maintained above the limit reference point this shall be taken as evidence that management measures are effective in avoiding overfishing.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include reports, fishery management plans, regulations or other management measures.

8.1.1 Management targets are consistent with achieving maximum sustainable yield (MSY) (or a suitable proxy) on average, or a lesser fishing mortality if that is optimal in the circumstances of the fishery (e.g. multispecies fisheries) or to avoid severe adverse impacts on dependent predators.

FAO Eco (2009) 29.2
FAO Eco (2011) 36.3

</tbody>
</table>
Evaluation Parameters

Process: There is a system to measure fleet capacity and maintain regularly updated data on all fishing operations.

Research has been conducted to determine or estimate the fishing capacity commensurate with the sustainable use of the resource. There are mechanisms in place to measure the total fishing capacity within the Unit of Certification, and to reduce this capacity if it is determined to exceed the sustainable level.

Current Status/Appropriateness/Effectiveness: There is evidence of the size of fleet capacity and of data describing fishing operation and that the mechanisms described above are successful at maintaining the effective fishing capacity of the Unit of Certification at a level commensurate with the sustainable use of the resource. Management mechanisms which restrict the application of fishing capacity, such as quotas, shall be considered valid mechanisms in relation to this parameter.

Evidence Basis: Availability, quality, and adequacy of the evidence. Examples may include, fleet reports or other documents or reports.

8.5 Technical measures shall be taken into account, where appropriate, in relation to:

- fish size
- mesh size or gear
- closed seasons
- closed areas
- areas reserved for particular (e.g. artisanal) fisheries
- protection of juveniles or spawners

Inconsistent methods, practices and gears are phased out accordingly. Fulfils all parameters.

### Evaluation Parameters

**Process:** The management system and relevant groups from the fishing industry have encouraged the development of technologies and operational methods to reduce waste and discard of the target species. ‘Relevant groups’ includes fishers, processors, distributors and marketers. There are mechanisms in place by which the selectivity, environmental impact and cost-effectiveness of gears included in the Unit of Certification are measured.

**Current Status/Appropriateness/Effectiveness:** Such technologies and operational methods have been implemented. The methods in use are effective in reducing waste and discards of the target species. There is evidence that the gears used in the fishery are appropriate, in terms of selectivity, environmental impact and cost-effectiveness, as assessed by the responsible scientific authority of the fishery. Methods shall be considered successful if there is evidence that the fishery under assessment is not causing significant risk of overfishing to non-target species.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various reports, regulations or other data.

8.9 Technologies, materials and operational methods or measures including, to the extent practicable, the development and use of selective, environmentally safe and cost effective fishing gear and techniques shall be applied to minimize the loss of fishing gear, the ghost fishing effects of lost or abandoned fishing gear, pollution and waste.

| Lacking in all parameters. | Lacking in two parameters. | Lacking in one parameter. | Fulfils all parameters. |

Evaluation Parameters

Note: The use of artificial structures may be appropriate for some stocks but not necessary for all. This clause may therefore not be applicable if such structures are not practical or appropriate for stocks. The use of artificial structures should be considered appropriate if one or more of the species under assessment has benefitted from the use of artificial structures in
other fisheries, or if species with similar biological characteristics have benefitted from the use of artificial structures in other fisheries.

**Process:** There is a mechanism in place for identifying potential for increasing stock populations and enhancing fishing opportunities through the use of artificial structures. This mechanism ensures that where artificial structures are deemed appropriate, environmental protection, safety, and navigation are considered in their application.

**Current Status/Appropriateness/Effectiveness:** This mechanism has been applied to the fishery under assessment, resulting either in the conclusion that artificial structures are inappropriate or in the use of artificial structures. Care has been taken in the selection of materials to use in constructing artificial reefs, the selection of sites for their deployment and to ensure that relevant conventions concerning the environment and the safety of navigation have been observed.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various laws, data and reports.

### 9. Fishing operations shall be carried out by fishers with appropriate standards of competence in accordance with international standards and guidelines and regulations.

Evaluation Parameters
Process: There are mechanisms established for fisheries monitoring, surveillance, control and enforcement.

Current Status/Appropriateness/Effectiveness: These mechanisms are effective, and include effective observer, inspection scheme, and vessel monitoring schemes where appropriate for the type of fishery under assessment. Monitoring, surveillance, control and enforcement mechanisms can be considered effective if they are sufficiently broad to cover the entirety of the Unit of Certification, there is evidence that rules and regulations are consistently enforced, and there is no evidence of frequent or widespread violation of fishery regulations. This could include relevant traditional, fisher or community approaches, provided their performance could be objectively verified. With respect to fisheries in the high seas, the legal obligations of UNCLOS and UNFSA have particular relevance. Evidence of the performance of the legal framework can be derived from the assessment of conformance with requirements covering compliance and enforcement.

Evidence Basis: Availability, quality, and adequacy of the evidence. Examples may include rules and regulations, enforcement reports.

10.2 Fishing vessels shall not be allowed to operate on the resource in question without specific authorization.

**Evaluation Parameters**

Not applicable if the fishery does not occur outside the State’s Exclusive Economic Zone.

**Process:** There is a mechanism or system established to conduct enforcement operations outside the country jurisdiction.

**Current Status/Appropriateness/Effectiveness:** This mechanism is enforcing operations in internationally occurring fisheries. If the stock under consideration is not transboundary, then the Standard need only be concerned with the effectiveness and suitability of the monitoring, surveillance, control and enforcement activities at the national level for the fishery of which the Unit of Certification is a part. If the Unit of Certification is part of a national fleet fishing on a transboundary stock, then it is still likely to be the effectiveness and suitability of the monitoring, surveillance, control and enforcement activities at the national level shall be assessed. If the Unit of Certification covers all the fishing on the stock under consideration, then the monitoring, surveillance, control and enforcement all of the national fleets is of concern and shall be assessed (to ensure full consideration of total fishing mortality on the stock under consideration).
Evidence Basis: Availability, quality, and adequacy of the evidence. Examples may include enforcement reports.

10.3.1 States which are members of or participants in sub-regional or regional fisheries management organizations or arrangements shall implement internationally agreed measures adopted in the framework of such organizations or arrangements and consistent with international law to deter the activities of vessels flying the flag of non-members or non-participants which engage in activities which undermine the effectiveness of conservation and management measures established by such organizations or arrangements. In that respect, Port States shall also proceed, as necessary, to assist other States in achieving the objectives of the FAO CCRF (1995), and should make known to other States details of regulations and measures they have established for this purpose without discrimination for any vessel of any other State.

12.3 The most probable adverse impacts of the fishery on the ecosystem/environment shall be considered, taking into account available scientific information, and local knowledge. In the absence of specific information on the ecosystem impacts of fishing for the unit of certification, generic evidence based on similar fishery situations can be used for fisheries with low risk of severe adverse impact. However, the greater the risk the more specific evidence shall be necessary to ascertain the adequacy of mitigation measures.

*FAO Eco* (2009) 30.4, 31, 31.4

*FAO Eco* (2011) 41.4
There is no accounting of most probable adverse impacts of the fishery on the ecosystem/environment. Few or no probable impacts are considered. There is no use of generic evidence on the ecosystem impact of fishing for the unit of certification.

Lacking in all parameters.

There is insufficient accounting of most probable adverse impacts of the fishery on the ecosystem/environment. Many probable impacts are not considered. There is insufficient availability or use of generic evidence on the ecosystem impact of fishing for the unit of certification.

Lacking in two parameters.

There is moderate accounting of most probable adverse impacts of the fishery on the ecosystem/environment. Some probable impacts are not considered. There is moderate availability or use of generic evidence on the ecosystem impact of fishing for the unit of certification.

Lacking in one parameter.

The most probable adverse impacts of the fishery on the ecosystem/environment are considered, taking into account available scientific information, and local knowledge. In the absence of specific information on the ecosystem impacts of fishing for the unit of certification, generic evidence based on similar fishery situations can be used for fisheries with low risk of severe adverse impact. However, the greater the risk the more specific evidence is necessary to ascertain the adequacy of mitigation measures.

Fulfils all parameters.

### Evaluation Parameters

**Process:** There is specific information on the ecosystem impacts of fishing for the unit of certification present. Also, there is a mechanism in place by which the most probable adverse impacts of the fishery on the ecosystem and environment are assessed using the best available scientific knowledge (which may include traditional knowledge where this is verifiable), and management objectives aimed at avoiding these impact are developed.

**Current Status/Appropriateness/Effectiveness:** There are management measures in place which have been developed to achieve the objectives described in the process parameter. All probable negative impacts are considered. Such impacts may include significant impacts on non-target fishery resources (including discards), gear-habitat interactions, endangered, threatened, protected (ETP) species interactions, and food web interactions. If information has been utilized from generic evidence based on similar fishery situations, based on the risk of severe adverse impact, the information shall be of higher precision for higher risk. For example, keystone species or species with relative low growth rates, high catchability, or fisheries with significant ETP, bycatch of non-target fishery resources (or non-target stocks or species or harvests or discards), or with important concerns for gear–habitat interactions can be considered high risk. If information specific to the unit of certification area is available, generic evidence based on similar fishery situations may not be necessary.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various stock and ecosystems assessment reports.

Guidance to Alaska RFM Performance Evaluation (Version 1.3) / Alaska RFM Conformance Criteria Version 1.3

Evaluation Parameters

**Process:** There is a process in place that allows for the creation of management objectives that seek to ensure that endangered species are protected from adverse impacts resulting from interactions with the unit of certification and any associated culture or enhancement activity, including recruitment overfishing or other impacts that are likely to be irreversible or very slowly reversible. A note on data collections. The adequacy of data relates primarily to the quantity and type of data collected (including sampling coverage) and depends crucially on the nature of the systems being monitored and purposes to which the data are being put. Some analysis of the precision resulting from sampling coverage would normally be part of an assessment of adequacy and reliability. The currency of data is important inter alia because its capacity for supporting reliable assessment of current status and trends declines as it gets older. The requirements for data collection are focussed on the effects of the unit of certification on endangered species.

**Current Status/Appropriateness/Effectiveness:** There is evidence of effective management objectives in place in the fishery under assessment (e.g. in a fishery management plan) that seek to ensure that endangered species are protected from adverse impacts resulting from interactions with the unit of certification and any associated culture or enhancement activity, including recruitment overfishing or other impacts that are likely to be irreversible or very slowly reversible.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include fishery management plans, stock and ecosystems assessment reports.

12.6 Non target catches, including discards, of stocks other than the “stock under consideration” shall be monitored and shall not threaten these non-target stocks with serious risk of extinction, recruitment overfishing or other impacts that are likely to be irreversible or very slowly reversible; if such impacts arise, effective remedial action shall be taken.

recruitment overfishing or other impacts that are likely to be irreversible or very slowly reversible. If such impacts arise, effective remedial action are moderately taken.

Lacking in one parameter.

other impacts that are likely to be irreversible or very slowly reversible. If such impacts arise, effective remedial action are taken.

Fulfils all parameters.

Evaluation Parameters

**Process:** There is a system to monitor non-target catches and discards of stocks other than the stock under consideration, and to determine the likelihood that these catches and discards represent a significant risk to the affected species. The assessment of risks shall support the achievement of appropriate management objectives for bycatch species.

**Current Status/Appropriateness/Effectiveness:** If catches endanger these stocks with serious risk of extinction, recruitment overfishing or other impacts that are likely to be irreversible or very slowly reversible serious risk of extinction, effective remedial action is taken by the management organization. Examples of irreversible or very slowly reversible effects on bycatch species include excessive depletion of very long-lived organisms. To mitigate effects that are likely to be irreversible or very slowly reversible requires those effects to be made less severe such that they are no longer likely to be irreversible or very slowly reversible. Examples of management measures may include incidental take allowances, bycatch caps, prohibited retention, safe release practices, or use of bycatch reduction devices or practices. Remedial action shall be considered effective if it reduces the impact of the fishery on non-target species to the point where there is no longer a risk of extinction.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various stock and ecosystems assessment reports.

12.7 The role of the “stock under consideration” in the food web shall be considered, and if it is a key prey species in the ecosystem, management objectives and measures shall be in place to avoid severe adverse impacts on dependent predators.

</tr>
</tbody>
</table>
Evaluation Parameters

**Process:** There is a mechanism in place by which the role of the stock under consideration in the food web is assessed and monitored, and its relative importance as a prey species is determined. If the species is considered by the relevant scientific authority to be an important prey species, there shall be specific management objectives relating to minimizing the impacts of the fishery on dependent predators. The FAO Guidelines require that all sources of fishing mortality on the stock under consideration are taken into account (whether or not it is a prey species) in assessing the state of the stock under consideration, including discards, unobserved mortality, incidental mortality, unreported catches and catches in other fisheries.

**Current Status/Appropriateness/Effectiveness:** There are management measures in place which have been developed to achieve the management objectives described in the process parameter, and there is evidence to demonstrate that they are successful to this end. If the species under assessment is not considered to be a key prey species, then this parameter shall be considered fulfilled.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various stock and ecosystems assessment reports.

12.8 States shall introduce and enforce laws and regulations based on the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978 relating thereto (MARPOL 73/78).

</table>
Lacking in two parameters.  | Lacking in one parameter.  | just that part of the spatial range that is potentially affected by fishing.  

**Fulﬁls all parameters.**

**Evaluation Parameters**

**Process:** There is a mechanism in place by which the potential impacts of the ﬁshery upon habitats essential to the stock under consideration and on habitats that are highly vulnerable to damage are identiﬁed. This or a similar mechanism shall also be in place to identify habitats which are highly vulnerable to ﬁshery activities by the Unit of Certiﬁcation. The information provided by these mechanisms shall be used to produce speciﬁc management objectives related to avoiding signiﬁcant negative impacts on habitats. The knowledge of the habitats in question can therefore include relevant traditional, ﬁsher or community knowledge, provided its validity can be objectively veriﬁed (i.e. the knowledge has been collected and analysed through a systematic, objective and well-designed process, and is not just hearsay). When identifying highly vulnerable habitats, their value to ETP species shall be considered, with habitats essential to ETP species being categorized accordingly.

**Current Status/Appropriateness/Effectiveness:** There are management measures in place which have been developed to achieve the objectives described in the process parameter, and have been successful in doing so.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various regulations, data and reports.

12.10 Research shall be promoted on the environmental and social impacts of ﬁshing gear and, in particular, on the impact of such gear on biodiversity and coastal ﬁshing communities.

Evaluation Parameters

**Process:** There is evaluation of the effects of aquaculture development on genetic diversity and ecosystem integrity, based on the best available scientific information.

**Current Status/Appropriateness/Effectiveness:** The research is deemed appropriate for maintaining genetic diversity and ecosystem integrity. Significant uncertainty is to be expected in assessing possible adverse ecosystem impacts of fisheries, including culture and enhancement activities. This issue can be addressed by taking a risk assessment/risk management approach.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various regulations, data and assessment reports.

13.1.1 In the case of enhanced fisheries, the fishery management system should take due regard of the natural production processes and be appropriate for the conservation of genetic diversity, biodiversity, protection of endangered species, maintenance of integrity of aquatic communities and ecosystems, minimizing adverse impacts on ecosystem structure and function.

---

**Low Confidence Rating (Critical NC)**

- In the case of enhanced fisheries, the fishery management system does not take due regard of the natural production processes and is not appropriate for the conservation of genetic diversity, biodiversity, protection of endangered species, maintenance of integrity of aquatic communities and ecosystems, minimizing adverse impacts on ecosystem structure and function.
- Lacking in all parameters.

**Medium Confidence Rating (Major NC)**

- In the case of enhanced fisheries, the fishery management system takes insufficient regard of the natural production processes and is insufficiently appropriate for the conservation of genetic diversity, biodiversity, protection of endangered species, maintenance of integrity of aquatic communities and ecosystems, minimizing adverse impacts on ecosystem structure and function.
- Lacking in two parameters.

**Medium Confidence Rating (Minor NC)**

- In the case of enhanced fisheries, the fishery management system takes moderate regard of the natural production processes and is moderately appropriate for the conservation of genetic diversity, biodiversity, protection of endangered species, maintenance of integrity of aquatic communities and ecosystems, minimizing adverse impacts on ecosystem structure and function.
- Lacking in one parameter.

**High Confidence Rating (Full Conformance)**

- In the case of enhanced fisheries, the fishery management system takes due regard of the natural production processes and is appropriate for the conservation of genetic diversity, biodiversity, protection of endangered species, maintenance of integrity of aquatic communities and ecosystems, minimizing adverse impacts on ecosystem structure and function.
- Fulfils all parameters.

---

**Evaluation Parameters**

**Process:** There are processes through which the management system can take due regard of the natural production processes, and which are appropriate for the conservation of genetic diversity, biodiversity, protection of endangered species, maintenance of integrity of aquatic communities and ecosystems, and for minimizing adverse impacts on ecosystem structure and function.
Current Status/Appropriateness/Effectiveness: There is evidence that the management system has taken due regard of the natural production processes (natural and enhanced populations) and is effective for the conservation of genetic diversity, biodiversity, protection of endangered species, maintenance of integrity of aquatic communities and ecosystems, minimizing adverse impacts on ecosystem structure and function.

Evidence Basis: Availability, quality, and adequacy of the evidence. Examples may include various regulations, data and reports.

13.2 State shall produce and regularly update aquaculture development strategies and plans, as required, to ensure that aquaculture development is ecologically sustainable and to allow the rational use of resources shared by aquaculture and other activities.

“stock under consideration”. Aquaculture production for stocking purposes is managed and developed according to the above provisions, especially in relation to maintaining the integrity of the environment, the conservation of genetic diversity, disease control, and quality of stocking material.

**Fulfils all parameters.**

### Evaluation Parameters

#### Process:

There is a process in place to develop enhanced fisheries supported in part by stocking of organisms produced in aquaculture facilities or removed from wild stocks other than the “stock under consideration”, whereby aquaculture production for stocking purposes is managed and developed in accordance with provisions entailing the maintenance of environmental integrity, the conservation of genetic diversity, disease control, and quality of stocking material. As appropriate, there are also management objectives and measures consistent with avoiding significant negative impacts of enhancement activities on the natural reproductive stock component of the stock under consideration and any other wild stocks from which the organisms for stocking are being removed.

#### Current Status/Appropriateness/Effectiveness:

These measures are effective. There is evidence of enhancement practices managed and developed in accordance with the maintenance of the integrity of the environment, the conservation of genetic diversity, disease control, and quality of stocking material.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various regulations, data and reports.

13.13 Regarding the enhanced components of the “stock under consideration”, provided that a natural reproductive stock component is maintained and fishery production is based primarily on natural biological production within the ecosystem of which the “stock under consideration” forms a part, enhanced fisheries shall meet the following criteria:

- the species shall be native to the fishery’s geographic area or introduced historically and have subsequently become established as part of the “natural” ecosystem;
- there shall be natural reproductive components of the “stock under consideration”;
- the growth during the post-release phase shall be based upon food supply from the natural environment and the production system shall operate without supplemental feeding.

### Evaluation Parameters

**Process:** There is a process in place by which enhanced fisheries are managed, and which includes consideration of the origin of enhanced species, the maintenance of naturally reproducing components, and the food supply during the post-release phase. The intent of this clause does not refer to net pen rearing after fish are removed from hatcheries, but to the time when salmon are released in the wild for their ocean migration.

**Current Status/ Appropriateness/ Effectiveness:** There is evidence to demonstrate that the species in the stock under consideration is native to the fishery’s geographic area, or was introduced historically and has subsequently become established as part of the “natural” ecosystem.

**Current Status/ Appropriateness/ Effectiveness:** There is evidence to demonstrate that there is a naturally reproductive component of the “stock under consideration”.

**Current Status/ Appropriateness/ Effectiveness:** There is evidence to demonstrate that the growth of the stocked component during the post-release phase is based upon food supply from the natural environment and the production system operates without supplemental feeding.

**Evidence Basis:** Availability, quality, and adequacy of the evidence. Examples may include various regulations, data and
13.14 In the case of enhanced fisheries, the “stock under consideration” may comprise naturally reproductive components and components maintained by stocking. In the context of avoiding significant negative impacts of enhancement activities on the natural reproductive components of “stock under consideration”:

- naturally reproductive components of enhanced stocks shall not be overfished;
- naturally reproductive components of enhanced stocks shall not be substantially displaced by stocked components. In particular, displacement shall not result in a reduction of the natural reproductive stock component below abundance-based target reference points (or their proxies) defined for the regulation of harvest.
